Function: (fixed input format temporarily)

Coronavirus situation search: return the latest number of suspected and identified people in a given location. In this version we merely show this for test. In the next one we would put these data in redis for convenience.

Rumor judge: such news is relatively in a small number and easy to catch. So we treat it the same way as the former and would put data in redis later.

Epidemic prevention materials recommend: return the top three research in taobao.com. Here use beautiful Soup and requests to catch the latest item information.

News acquire: provide relative news about the virus and people in different areas. Here we use baidu news to research the latest ones.

Position relative recommend: hope to provide users a detailed location when they ask if there's any medical shop nearby or where to buy some shortage things. Here we take advantage of Google map to provide locate.

Version 1.0 conclude: This version is more like a demo and testing of our aim about this public health care demand. In this one we ever tested some other information sources and areas, and achieved a basic supposing design of this bot. And for a bot, these functional communication provide our basic aim of function usage. In next version 2.0 we hope to make it more intelligent as a bot based on them. And chatting function would be added to make a fluent information exchange between users and this bot.
